Team Agreements

This agreement is aimed at creating a work method where each team member knows the production requirements These may vary over time according to the production development: There may be stages where the workload will be higher for the conceptual directors, and in other stages, the tech and programming team will have to kick it with more time investment than in the early stages.

This agreement aims to establish a working relationship and timeframe where each of you knows your time requirement for individual work, as well as for group meetings and decision making.

- ***Goal*** : What is the purpose of the team which unifies you?

The goal of this project is to create a physical set/item that people can interact with. I may get help from specialized classmates for certain tasks in fabrication, audio, etc but that is only a slight possibility right now.

- ***Decision Making*** : Does everyone have to agree before making any change to the project? What happens in case of a disagreement? Is there a director who is in charge of the overall vision, and therefore gets to make the final decision based on the input of each member?

I will make all the stylistic choices and do all of the fabrication myself. I may recruit help for sound, the building of the project, or other small tasks, but I will likely end up doing this all myself.

- ***Collaboration tools:*** How do you share files? What platform do you find most efficient and flexible for everyone to share and synchronize with others?

Google docs, storing my files on my laptop.

- ***Meetings per week***: (This should be updated as the project develops) Please Specify How many meetings per week besides class time, and on which platform (In person \ Zoom\ Other).

N/A

- ***Participation expectations:*** An estimation of the Scope of work in hours per week, expected from each group member. This will undergo changes as the project develops.

N/A

Roles and Responsibilities (Who is doing what):

- ***Installation design and Concepts:***
  Who is directing the experience, and if it is a shared thinking, how are decisions being made? Whose responsibility is it to update the Design values document along the production process?

- Programming: maybe a system that causes audiovis reaction to behaviours in the room? Triggers sounds, video effects from camera recordings of participants

- ***Art Direction :***

- Sound Design: gradually changing soundscape like footsteps, creaks, beeps, etc

- ***Art Implementation: Animation \ Video\ live action,or any other source material manufacturing:***
  Please specify responsibilities according to your installation components. You should relate to modeling\ rigging and animation as separate tasks, and specify who does what. The same goes for live footage shooting which requires a photographer, and an editor. All the roles involved in the making of your Installation's core material should be broken down to their creation process stages, and specified.

Building the physical house, decorating the room (design a path and environment for the house), projecting on the walls, small screens/mirrors in the house?

- ***Direction of Prototyping and Testing***: This responsibility may change and shift according to the prototype's nature: Naturally, tech and core design prototypes should be managed by the programmers, while art or other playtests could be directed by the art and concept team members.

Solo project, I will do it all.

Design Values Document:

- ***Short description of your installation:*** Describe in brief the core characteristics of your installation: Idea, Spatial design, Number of simultaneous participants, and primary techniques involved (AR|VR|PROJECTION| OTHER).

Interactive unwelcome Dollhouse installation, spatial physical object room design, solo project, primary technique is physical with projection/screen & audio effects

- ***Experience:*** What do the participants get to do when experiencing your installation? How does it make them feel physically or emotionally?

The ideal goal is for participants to automatically explore the installations by walking around, looking into it, poking around, etc. as they explore, the audio and projections/screens are going to subtly change until the viewers start to feel uncomfortable, unwelcome, and ideally creeped out by the space.

- ***Theme***: What is the Installation about? How does it represent this to the participants? What concepts, Perspectives, or experiences might the participants encounter during the experience? How are these delivered? (Through a story/Image/metaphor?).

This is installation is about privacy, intrusion, and weird dynamics between private matters, voyeurism, etc. The participants are meant to want to explore the installation and look over everything in close detail, but this default reaction/expected behaviour will be questioned by the uncomfortable elements that arise. It frames it in a confusing way like the participants aren't welcome, that the roles reverse where what viewers were investigating are now being watched in the house. The participant will be slowly surrounded and feel the discomfort of feeling like an intruder or like a person being tricked.

- ***Point of view***: What does the participant see, hear, or feel? From what cultural reference point?

The participant will first encounter the house set in the room, guided by a simple path to stick to a specific course to explore the installation. As far as the gradual changes in audio and visuals, the ambient noise will become uncomfortable, like using beeps, electronic humming, footsteps, furniture shifting, distorted voices, etc. Visually, maybe having the lights change from warm to cold, the projections on the walls color grading changes too, glitches, the mini screens in the house start showing distorted footage of people who visited, shadows creeping around getting projected on the ground, etc.

- ***Artistic Style***: How is the information within it represented? Is it very realistically detailed? How is the style correlated to your concept and storytelling approach? We relate to Concept Art as part of the director's nonverbal statement about the installation's theme. It's a storytelling tool that conveys a message through

artistic style, editing style, and movement. If you already envisioned an artistic style for your work, check it and tweak it according to these criteria.

Conceptually I think the style is going to be kind of like Don't Hug Me I'm Scared in idea (setlike, show cuteness/curation) but stylistically it would be a bit empty and strange like backrooms but a little more ideal suburban stillness. This would help the message because it would help with the strangeness by making things obviously curated but strangely unnatural and fakely warm.

- ***Challenges and constraints:*** What are the participants encouraged to do? How do you make them active —emotionally or physically?

The participants are encouraged to explore like it's a regular installation, to walk in, investigate the space, look closely at the house, and try to be "intrusive" and voyeuristic. The hardest part will probably be getting people to stay long enough for the gradual effects to work effectively and make them uncomfortable.

- ***Context***: Where is the installation placed? Does it depend on a specific physical environment? Who is your audience—could they be passersby, or does it ideally belong in a gallery? (For art-oriented public?)

The installation will be placed ideally in a small room dedicated solely to the house and the artificial environment I want to set it in. The audience should actively choose to enter the room and experience being in the designed space.

- ***Emotion:*** How would you like your participants to feel after experiencing your installation? What are they left with?

I hope they feel a little uncanny and uncomfy or a little weirded out by it. I wanted it to be a physically focused experience that feels a little subtle.
